

c) What is the big-oh of Algorithm 2?

Algorithm 2:

```
result = 0
for r in range(n):
    c = n
    while c > 1:
        result = result + c
        c = c // 2
    # end while
# end for
```

d) What is the big-oh of Algorithm 3?

Algorithm 3:

```
result = 0
for r in range(n):
    for c in range(n):
        result = result + c
    # end for
# end for
```

e) What is the big-oh of Algorithm 4?

Algorithm 4:

```
result = 0
for r in range(n):
    for c in range(n):
        for d in range(n*n*n):
            result = result + d
        # end for
    # end for
# end for
```

f) What is the big-oh of Algorithm 5?

Algorithm 5:

```
result = 0
i = 0
while i < 2**n:
    result = result + i
    i += 1
# end while
```

g) Complete the following timing table from the output of timeStuff.py.

Algorithm	Execution Time in Seconds					
	n = 0	n = 10	n = 20	n = 30	n = 40	n = 50
Algorithm 0						
Algorithm 1						
Algorithm 2						
Algorithm 3						
Algorithm 4						
Algorithm 5				(work on h & i while waiting)		

h) For Algorithm 5, use the timing for $n = 20$ to compute the *constant of proportionality* on the fastest growing term.

i) Using the constant of proportionality computed in (h), predict the run-time of Algorithm 5 for $n = 30$.

j) How does your prediction in (i) compare to the actual time from (g)?

After you have answered the above questions, raise your hand and explain your answers.

Part B: The lab2.zip file also contains:

- a simple Die class (in the simple_die.py module) for a six-sided die, and
 - an AdvancedDie class (in the module advanced_die.py module) for a die which can be constructed with any number of sides. The AdvancedDie class inherits from the Die class.
- a) Write a new program that used AdvancedDie class (“from simple_die import AdvancedDie”) to:
- create two 10-sided AdvancedDie objects
 - roll the pair of dice 1000 times
 - determine and print the average outcome (i.e., average total on the pair of dice) on the pair of dice during the 1000 rolls.

b) For testing certain dice games, suppose we want to extend the `AdvancedDie` class to include a new method `setRoll` which takes as a parameter a roll value that is used to set a die's roll to a specified value. We might invoke this method as:

```
myDie.setRoll(3)    # sets myDie to a current roll of 3
```

Implement a new subclass `MoreAdvancedDie` (in a new file `more_advanced_die.py`) which inherits from the `AdvancedDie` class, and includes the new `setRoll` method. When implementing the `MoreAdvancedDie` class: (see the `AdvancedDie` class and its methods, especially the `__init__` method as an example)

- Include documentation with the `MoreAdvancedDie` class (right below its `class` line)
- Include documentation with the `setRoll` method including preconditions and postconditions
- Enforce preconditions by raising appropriate exceptions.

c) View the programmer-authored documentation for the `MoreAdvancedDie` class by typing `help(MoreAdvancedDie)` at the IDLE shell prompt ("`>>>`") after selecting Run | Run Module in the file `more_advanced_die.py` which contains the `MoreAdvancedDie` class.

After you have implemented AND fully tested your `MoreAdvancedDie` class, raise your hand and demonstrate it.

If you complete all parts of the lab, nothing needs to be turned in for this lab. If you do not get done today, then show me the completed lab in next week's lab period. When done, remember to log off and take your USB drive.

If you have extra time, this would be a good chance to work on Homework #1!
